gabis

The AI-native financial operating system for Africa.

Money that moves itself. Not a wallet with AI bolted on — AI doing the work around the money: collecting it, explaining it, putting it aside.

Autonomous collections in 5 Nigerian languages

Copilot over real transactions

Built with Gemini

THE PROBLEM

Financial data exists.
Financial intelligence does not.

A Lagos merchant's money moves across a bank account, MTN MoMo, cash, informal credit and two currencies. Every transaction is recorded somewhere. Almost none of it is ever turned into a decision.

WHAT THEY GET TODAY

A list of transactions.

A balance. Statements they cannot interpret, in an app that waits to be told what to do.

WHAT THEY ACTUALLY NEED

An answer.

Can I afford stock this month? What is quietly draining me? Which customer is about to default?

WHY NOBODY SOLVED IT

Reasoning was too expensive.

And too shallow — no model understood Nigerian merchant behaviour, Pidgin, or mobile money.

THE INSIGHT

Africa fixed payments infrastructure. It never built the intelligence layer on top.

A decade of work made money move — Paystack, Flutterwave, M-Pesa, instant NIP transfers. The rails are solved. What sits on top of them is still a ledger with a search box.

Gabis is building the layer that reads those rails and acts on them.

PRODUCT · SHIPPED

A copilot that reads your money

Ask in plain language. The answer comes from the user's own transaction history — not a generic tip.

- Finds commitments on its own by grouping counterparties across months
- Detects what changed month over month, by category
- Answers "can I afford this?" against commitments, burn rate and a buffer
- Payday sweep: puts aside what is genuinely spare, capped and reversible
- Acts only on approval — every money-moving step is confirmed

```
// engine output, real run

recurring detected
Lekki Gardens  ₦180,000/mo rent
Mrs Gab-Momoh  ₦80,000/mo family
MTN  ₦43,200/mo airtime

category shift
Airtime & data +31%

safe to spend
₦669,178
after commitments and a one-week buffer
```

PRODUCT · SHIPPED

An agent that collects the debt itself LIVE

When an invoice goes overdue, the agent negotiates with the customer in their own language, understands a payment promise, sets the follow-up date, sends a one-tap WhatsApp link, and updates the invoice when the money lands. Not a recorded IVR tree — a conversation, on African telecom rails.

UNDERSTAND

Overdue detected

Invoice ledger flags the balance and the customer.

REASON

Approach chosen

Language, tone and timing selected for that customer.

ACT

Call placed

The agent explains the balance and hears the promise.

SETTLE

Invoice cleared

WhatsApp link; payment updates the ledger itself.

This is the part that is hard to copy: it runs on African telecom rails, in African languages, against African payment behaviour.

HOW IT WORKS

The numbers are computed. The judgement is the model's.

Most finance apps ask a model to do arithmetic and hope it is right. We do the opposite.

ON DEVICE — DETERMINISTIC CORE

A core that cannot hallucinate

Categorisation, recurring commitments, month-over-month drift, daily burn, projected balance at payday, affordability with a buffer. Correct, offline, no key, no per-query cost.

WITH GEMINI — REASONING LAYER

A model that does the talking

Open-ended dialogue over that state, multimodal ingestion of photographed receipts and PDF statements, and collections calls that hold a real conversation. Gemma for on-device inference where data should not leave the phone.

ALWAYS

You approve before money moves

The model explains, drafts and asks. Every transfer, sweep and settlement waits for a human. No automation here can spend on the user's behalf.

The seam already exists in the codebase: the engine returns structured facts, a thin layer phrases them. Swapping that layer for Gemini is a contained change — which is exactly why 10 weeks is enough.

WHY NOW

Three things became true at once

01

Reasoning got cheap

Per-user financial reasoning was economically impossible at African ARPU two years ago. It is now viable.

02

Voice crossed the line

Conversational agents can hold a real collections call in Pidgin or Swahili — not a recorded IVR tree.

03

The data finally exists

Mobile money and instant transfers created a decade of machine-readable behaviour that nobody is reading.

The window is the gap between the rails maturing and the intelligence layer being claimed. It is open now.

THE NEXT CAPABILITY

One capability, built properly

Not five shallow integrations. One: a financial reasoning agent that ingests the messy records African businesses actually keep — photographed receipts, PDF statements, WhatsApp order threads — and turns them into the same structured state the copilot already reasons over.

GEMINI

Multimodal ingestion

Open-ended financial reasoning over user state.

GEMMA

On-device inference

Where financial data should never leave the phone.

RELIABILITY

Evaluated, not assumed

Measuring agent reliability where a wrong answer costs a user real money.

Measurable outcome: ingestion accuracy on real Nigerian receipts and statements, and whether copilot recommendations change what users actually do.

WHERE WE ARE

Built, not pitched

LIVE TODAY · SHIPPED

Working product on web

Accounts, cards, transfers, FX, invoicing with instalments, bill payments, the AI copilot, payday sweep, and a business dashboard whose ledger persists and reaches debtors on WhatsApp, SMS, voice and email. gabis.pages.dev

RAILS INTEGRATED

NGN, USD, KES, GHS

Mobile money and bank rails, US checking details for ACH and wire receipts from global platforms.

NEXT · IN BUILD

Gemini on top of the core

Multimodal ingestion of photographed receipts and PDF statements, open-ended dialogue over user state, and agent reliability evaluation.

Founder-built. The copilot engine, the collections agent and the payment rails in this deck are running code, not mockups.

THE ASK

Every African business will have a financial brain.
We are building it.

Gabis starts as the copilot that reads your money and the agent that collects it. It ends as the AI-native operating system every African merchant, freelancer and institution runs their financial life on.
