GOOGLE AFRICA APPLIED AI LAB · 2026

Gabis

The financial intelligence layer for African consumers and businesses — software that doesn't just move money, but understands it and acts.

AI copilot over real transactions

Autonomous voice collections

Multi-currency rails

gabis.pages.dev · Raphael Gab-Momoh

THE PROBLEM

Financial data exists.
Financial intelligence does not.

A Lagos merchant's money moves across a bank account, MTN MoMo, cash, informal credit and two currencies. Every transaction is recorded somewhere. Almost none of it is ever turned into a decision.

What they get today

A list of transactions. A balance. Statements they cannot interpret, in an app that waits to be told what to do.

What they actually need

To know whether they can afford stock this month, what is quietly draining them, and which customer is about to default.

Why nobody solved it

The reasoning was too expensive and too shallow — and no model understood Nigerian merchant behaviour, Pidgin, or mobile money.

THE INSIGHT

Africa fixed payments infrastructure. It never built the intelligence layer on top.

A decade of work made money move — Paystack, Flutterwave, M-Pesa, instant NIP transfers. The rails are solved. What sits on top of them is still a ledger with a search box.

Gabis is building the layer that reads those rails and decides.

PRODUCT · SHIPPED

A copilot that reads your money

Ask in plain language. The answer comes from the user's own transaction history — not a generic tip.

- **Finds commitments on its own** by grouping counterparties across months
- **Detects what changed** month over month, by category
- **Answers "can I afford this?"** against commitments, burn rate and a buffer
- **Acts only on approval** — every money-moving step is confirmed

```
// engine output, real run
recurring detected
  Lekki Gardens  ₦180,000/mo rent
  Mrs Gab-Momoh  ₦80,000/mo family
  MTN  ₦43,200/mo airtime

category shift
  Airtime & data +31%

safe to spend ₦669,178
  after commitments and a one-week buffer
```

PRODUCT · SHIPPED

An agent that collects the debt itself live

When an invoice goes overdue, Gabis dispatches a conversational voice call over Africa's Talking, explains the balance in the customer's own language, and sends a one-tap WhatsApp payment link — then schedules its own retries.

UNDERSTAND

Overdue detected

Invoice ledger flags the balance and the customer.

REASON

Approach chosen

Language, tone and timing selected for that customer.

ACT

Call placed

Voice agent explains the balance and answers questions.

SETTLE

Link sent

WhatsApp payment link; retries scheduled if unpaid.

This is the part that is hard to copy: it runs on African telecom rails, in African languages, against African payment behaviour.

HOW IT WORKS

State on device. Reasoning from the model.

Today — deterministic core

Gabis computes each user's financial state on device: categorisation, recurring commitments, month-over-month drift, daily burn, projected balance at payday, affordability with a buffer.

Correct, offline, no key, no per-query cost. The numbers can never hallucinate.

With the Lab — reasoning layer

Gemini sits on top of that state for open-ended dialogue, multimodal ingestion of receipts, invoices and bank statements, and agentic execution of approved workflows.

Gemma for cheap on-device inference where data should not leave the phone.

The seam already exists in the codebase: the engine returns structured facts, a thin layer phrases them. Swapping that layer for a model is a contained change — which is exactly why 10 weeks is enough.

WHY NOW

Three things became true at once

01

Reasoning got cheap

Per-user financial reasoning was economically impossible at African ARPU two years ago. It is now viable.

02

Voice crossed the line

Conversational agents can hold a real collections call in Pidgin or Swahili — not a recorded IVR tree.

03

The data finally exists

Mobile money and instant transfers created a decade of machine-readable behaviour that nobody is reading.

The window is the gap between the rails maturing and the intelligence layer being claimed. It is open now.

One capability, built properly

Not five shallow integrations. One: **a financial reasoning agent that ingests the messy records African businesses actually keep** — photographed receipts, PDF statements, WhatsApp order threads — and turns them into the same structured state the copilot already reasons over.

Gemini

Multimodal ingestion and open-ended financial reasoning over user state.

Gemma

On-device inference where financial data should never leave the phone.

Google researchers

Evaluating agent reliability where a wrong answer costs a user real money.

Measurable outcome by demo day: ingestion accuracy on real Nigerian receipts and statements, and whether copilot recommendations change what users actually do.

WHERE WE ARE

Built, not pitched

Live today shipped

Working multi-currency product on web — accounts, cards, transfers, FX, invoicing with installment schedules, bill payments, and the AI copilot.

gabis.pages.dev

Rails integrated

NGN, USD, KES, GHS. Mobile money and bank rails, US checking details for ACH and wire receipts from global platforms.

Next in build

Multimodal ingestion of receipts and statements; the reasoning layer over the deterministic core; agent reliability evaluation.

Founder-built. The copilot engine, the collections agent and the payment rails in this deck are running code, not mockups.

Every African business will have a financial brain.
We are building it.

Gabis starts as the copilot that reads your money and the agent that collects it. It ends as the intelligence layer every African merchant, freelancer and institution runs their financial life on.
